# The only way to scale security is to empower developers

"The ratio of engineers in Development, Operations, and Infosec in a typical technology organization is 100:10:1.

When Infosec is that outnumbered, without automation and integrating information security into the daily work of Dev and Ops, Infosec can only do compliance checking, which is the opposite of security engineering – and besides, it also makes everyone hate us."

- Gene Kim  
Co-Author of The DevOps Handbook

**DevSecOps is the way!**

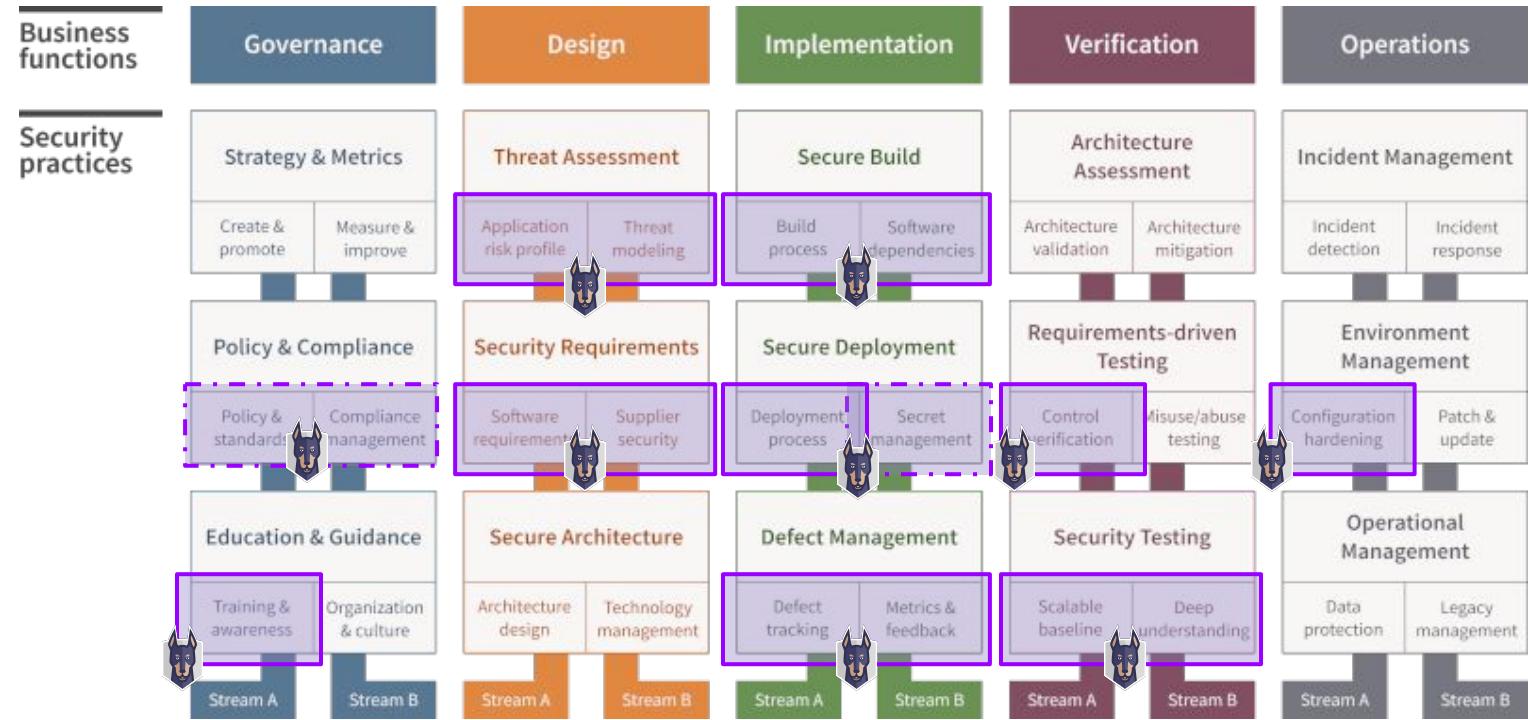

# Motivation

It's always about People, Processes, Technology (Tools)

- Snyk aims to be a **Trusted Advisor** to its customers when it comes to DevSecOps and Application Security Programs.
- **Win-Win:** Maturing DevSecOps will benefit both sides.

Supporting organizations that have **mature DevOps** processes in place but are just **starting** out with **DevSecOps** (and without any framework or model in place).

# Security Framework & Maturity Model Landscape

NIST CSF  
2.0

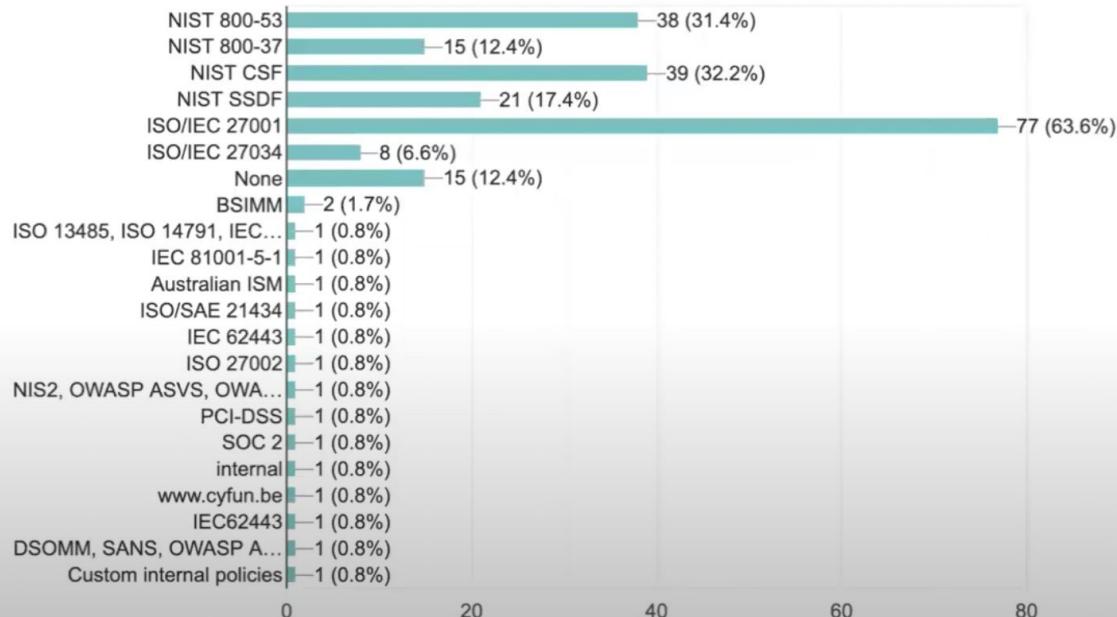

ASVS

COBIT®  
An ISACA Framework

## What standards or maturity models are you using in conjunction with SAMM?

121 responses

# Why a Framework?

- Follow a structured approach
- “You can’t manage what you can’t measure”
- Not reinventing the wheel
- Learn from others, field-proven best-practices

# Selection Criterias

- **Measurable**

Defined maturity levels across security practices

- **Actionable**

Clear pathways for improving maturity levels

- **Versatile**

Technology, process, and organization agnostic

- **Open**

Established non-proprietary with a large community

# OWASP SAMM

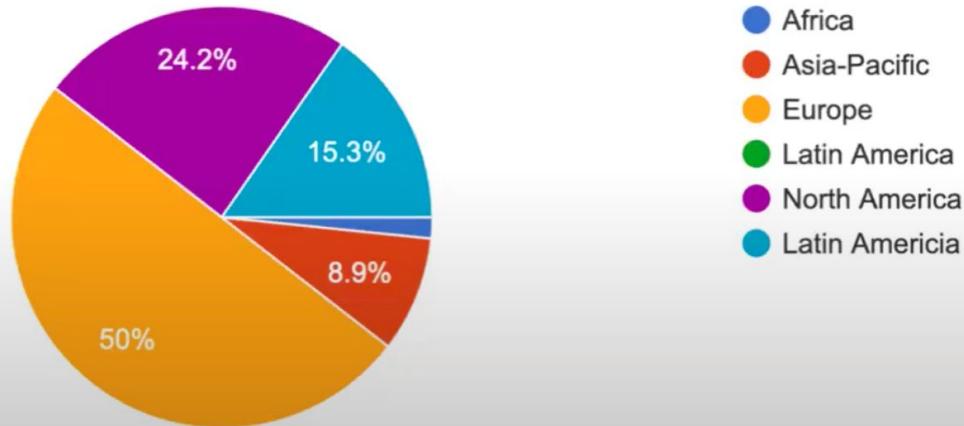

- OWASP Software Assurance Maturity Model (SAMM)
- OpenSAMM 1.0 (2009), OWASP SAMM 1.1 (2016) +
- Focus on Application Security
- Flagship project at OWASP
- Prescriptive in Nature (as opposed to descriptive / BSIMM)

*The mission of OWASP Software Assurance Maturity Model (SAMM) is to be the prime maturity model for software assurance that provides an effective and **measurable** way for all types of organizations to analyze and **improve** their software security posture. OWASP SAMM supports the complete software lifecycle, including development and acquisition, and is **technology and process agnostic**. It is intentionally built to be evolutive and risk-driven in nature.*

## In what geographic area are you primarily located?

124 responses

# Why would you use SAMM?

- To have a “holistic” and structured approach to application security
- [As a CISO] to have your story resonate at the level of management
- [As a Developer] to get rid of “it’s a developer’s problem” mentality, which it’s not!
- [As a Project Manager] to get to a shift-left approach to increase efficiency and predictability of software delivery
- [As a Client] to understand how your supplier is performing

# The structure and setup of OWASP SAMM is made to support:

1. the **assessment** of the current software assurance posture,
2. the definition of the **strategy** (i.e. the target) that the organization should implement,
3. the formulation of an implementation **roadmap** of how to get there, and
4. prescriptive advice on how to **implement** particular activities.

# PREPARE

PREPARE

ASSESS

SET THE TARGET

DEFINE THE PLAN

IMPLEMENT

ROLL OUT

**Purpose** Ensure a proper start of the project

#### Activities

Define the scope Set the target of the effort: the entire enterprise, a particular application or project, a particular team.

Identify stakeholders Ensure that important stakeholders are identified and well aligned to support the project.

Spread the word Ensure that important stakeholders are identified and well aligned to support the project.

#### Resources

Consider involving at least

- Executive Sponsor
- Security Team
- Developers
- Architects
- Business Owners
- QA Testers
- Managers

SAMM project page - OWASP website <https://owasp.org/www-project-samm/>

Blog post on determining scope <https://owasp-samm.org/blog/2023/05/24/determining-scope-when-implementing-samm/>

#### Best practices

Pre-screen software development maturity to have realistic expectations

The smaller the scope, the easier the exercise

# Considerations picking a Framework

- Do you agree on the framework?
- Do you agree on the model/content?
  - Does it need customization?
  - Customization vs. accepting low maturity acceptance
- Is Budget available and planned in?
  - Tool licenses, internal man hours, external consultants
- Educate all Stakeholders

# SECURITY TESTING

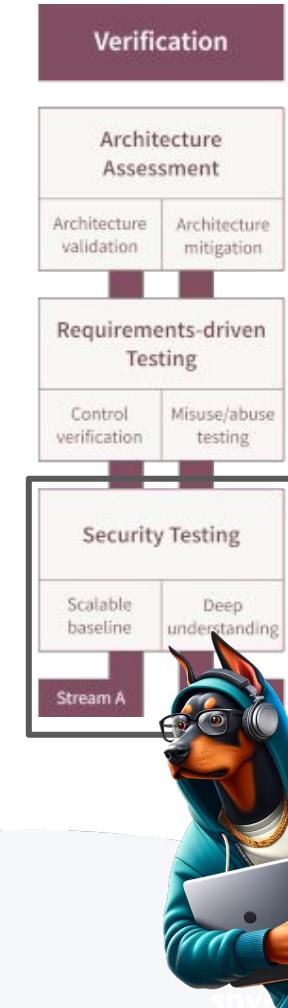

## Model | Verification | Security Testing

The Security Testing (ST) practice leverages the fact that, while automated security testing is fast and scales well to numerous applications, in-depth testing based on good knowledge of an application and its business logic is often only possible via slower, manual expert security testing. Each stream therefore has one approach at its core.

The first stream focuses on establishing a common security baseline to automatically detect so-called "low hanging fruit". Progressively customize the automated tests for each application and increase their frequency of execution to detect more bugs and regressions earlier, as close as possible to their inception. The more bugs the automated processes can detect, the more time experts have to use their knowledge and creativity to focus on more complex attack vectors and ensure in-depth application testing in the second stream. As manual review is slow and hard to scale, reviewers prioritize testing components based on their risk, recent relevant changes, or upcoming major releases. Organizations can also access external expertise by participating in bug bounty programs, for example.

Unlike the Requirements-driven testing practice which focuses on verifying that applications correctly implement their requirements, the goal of this practice is to uncover technical and business-logic weaknesses in application and make them visible to management and business stakeholders, irrespective of requirements.

Maturity level	Stream A Scalable Baseline	Stream B Deep Understanding
1	Perform security testing (both manual and tool based) to discover security defects.	Utilize automated security testing tools.
2	Make security testing during development more complete and efficient through automation complemented with regular manual security penetration tests.	Employ application-specific security testing automation.
3	Embed security testing as part of the development and deployment processes.	Integrate automated security testing into the build and deploy process.
		Integrate security testing into development process.

# SCALABLE BASELINE

[Model](#) | [Verification](#) | [Security Testing](#) | **Scalable Baseline**

[MATURITY LEVEL 1](#)[MATURITY LEVEL 2](#)[MATURITY LEVEL 3](#)

## Benefit

Detection of common easy-to-find vulnerabilities

## Activity

Use automated static and dynamic security test tools for software, resulting in more efficient security testing and higher quality security tests and extend code coverage.

Application security testing can be performed statically, by inspecting an application's source code without running it, or dynamically, in response to various input conditions. The former approach is often referred to as Static Application Security Testing (SAST), the latter as Dynamic Application Security Testing (DAST). A hybrid approach, known as Interactive Application Security Testing (IAST), combines the strengths of both approaches (at the cost of additional overhead) by dynamically testing automatically instrumented applications, allowing accurate monitoring of the application's internal state in response to external input.

Many security vulnerabilities are very hard to detect without carefully inspecting the source code. While this is ideally performed by expert or peer review, it is a slow and expensive task. Although "noisier" and frequently less accurate than expert-led reviews, automated SAST tools are cheaper, much faster, and more consistent than humans. A number of commercial and free tools are able to efficiently detect sufficiently important bugs and vulnerabilities in large code bases.

Dynamic testing does not require application source code, making it ideal for cases where source code is not available. It also identifies concrete instances of vulnerabilities. Due to its "black-box" approach, without instrumentation, it is more likely to uncover shallow bugs. Dynamic testing tools need a large source of test data whose manual test generation is prohibitive. Many tools exist which generate suitable test data automatically, leading to more efficient security testing and higher quality results.

# ASSESS

PREPARE

ASSESS

SET THE TARGET

DEFINE THE PLAN

IMPLEMENT

ROLL OUT

**Purpose** Identify and understand the maturity of your chosen scope in each of the 15 software security practices

### Activities

Evaluate current practices	Organize interviews with relevant stakeholders to understand the current state of practices within your organization. You could evaluate this yourself if you understand the organization sufficiently enough. SAMM provides lightweight and detailed assessments, where the latter is an evidence-based evaluation, use the detailed one only if you want to have absolute certainty about the scores.
Determine maturity level	Based on the outcome of the previous activity, determine for each security practice the maturity level according to the SAMM maturity scoring system. Activities are scored by a multiple choice system and are averaged out for the security practice area, then added together to determine the overall score.

Improvement

## L1: Do you scan applications with automated security testing tools?

- You dynamically generate inputs for security tests using automated tools
- You choose the security testing tools to fit the organization's architecture and technology stack, and balance depth and accuracy of inspection with usability of findings to the organization

No

Yes, some of them

Yes, at least half of them 0.50

Yes, most or all of them

## L2: Do you customize the automated security tools to your applications and technology stacks?

- You tune and select tool features which match your application or technology stack
- You minimize false positives by silencing or automatically filter irrelevant warnings or low probability findings
- You minimize false negatives by leverage tool extensions or DSLs to customize tools for your application or organizational standards

No

Yes, some of them

Yes, at least half of them 0.50

Yes, most or all of them

## L3: Do you integrate automated security testing into the build and deploy process?

- Management and business stakeholders track and review test results throughout the development cycle
- You merge test results into a central dashboard and feed them into defect management

No

Yes, some of it

Yes, at least half of it

Yes, most or all of it 0.00

# SET THE TARGET

PREPARE

ASSESS

SET THE TARGET

DEFINE THE PLAN

IMPLEMENT

ROLL OUT

**Purpose** Develop a target score that you can use as a measuring stick to guide you to act on the most important activities for your situation

#### Activities

Define the target

Set or update the target by identifying which activities your organization should implement ideally. Typically, this will include more lower-level than higher-level activities. Ensure that the total set of selected activities makes sense, and take into account dependencies between activities.

Estimate overall impact

Estimate the impact of the chosen target on the organization. Try to express in budgetary arguments.

#### Resources

SAMM roadmap chart

Worksheet (part of the SAMM Benchmark as a comparative source)

Leverage the Roadmap worksheet in the SAMM Toolbox to help calculate maturity score improvements based on future answers

#### Best practices

Take into account the organization's risk profile

Respect dependencies between activities

As a rough measure, the overall impact of a software assurance effort is estimated at 5 % to 10% of the total development cost

# Recommendations from the Field

I would focus on making sure the team has **basic security training**. I would also focus on getting to maturity **level 2 for Secure Build** and **Secure Deploy** activities.

From there onwards I'd look into **security requirements** (ASVS) and requiring mandatory unit/integration tests for at least some of them. **Tooling** could also be interesting to look at or at least experiment with and to see which tools and tool categories you could add to your development processes.

Aram Hovsepyan, via [OWASP Slack channel](#)

# Recommendations from the Field

Identify your **target maturity**, based on

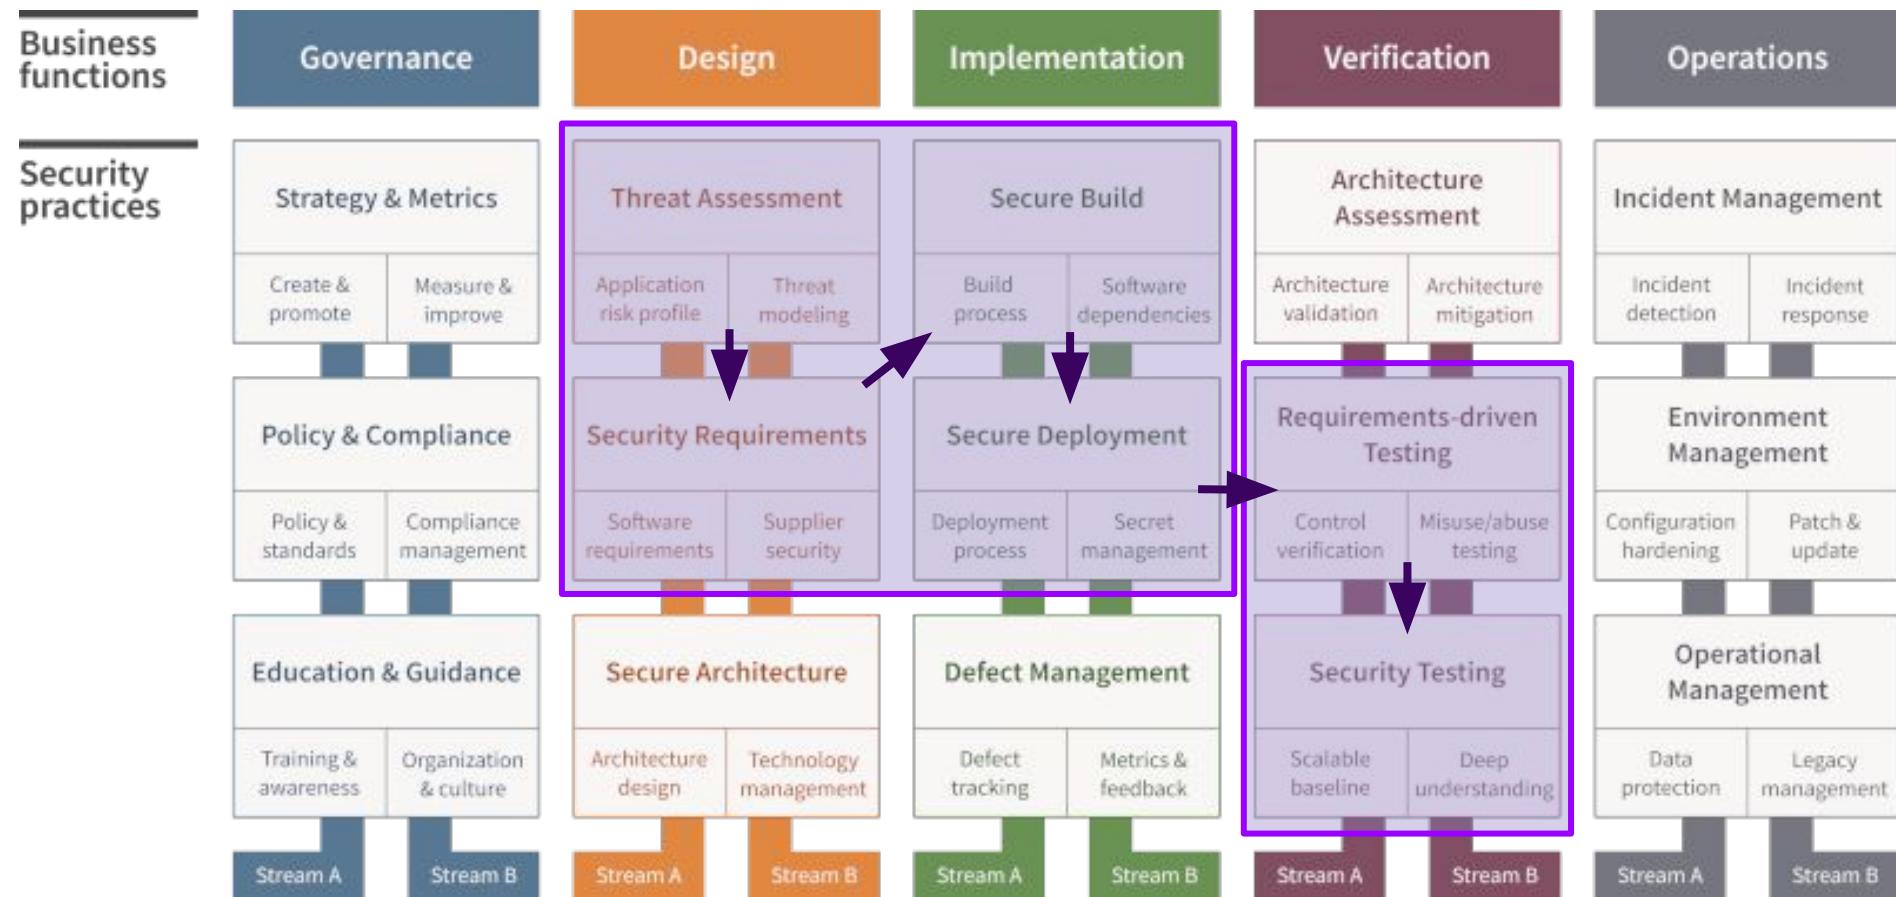

- your current capabilities
- teams involved
- tech-stack
- suppliers, etc.
- organization risk profile and appetite

Be realistic in your first target maturity and **time** horizon, based on available **budget** and willingness for **change**. There is no standard solution for this, as this is unique for every organization and its risk / compliance environment.

Seba, via [OWASP Slack channel](#)

# Typical Developers' Touchpoints / "Critical Path"

snyk

# DEFINE THE PLAN

PREPARE

ASSESS

SET THE TARGET

DEFINE THE PLAN

IMPLEMENT

ROLL OUT

**Purpose** Develop or update your plan to take your organization to the next level

#### Activities

Determine change schedule

Choose a realistic change strategy in terms of number and duration of phases. A typical roadmap consists of 4 to 6 phases for 3 to 12 months.

Develop/update the roadmap plan

Distribute the implementation of additional activities over the different roadmap phases, taking into account the effort required to implement them. Try to balance the implementation effort over the different periods, and take dependencies between activities into account.

#### Resources

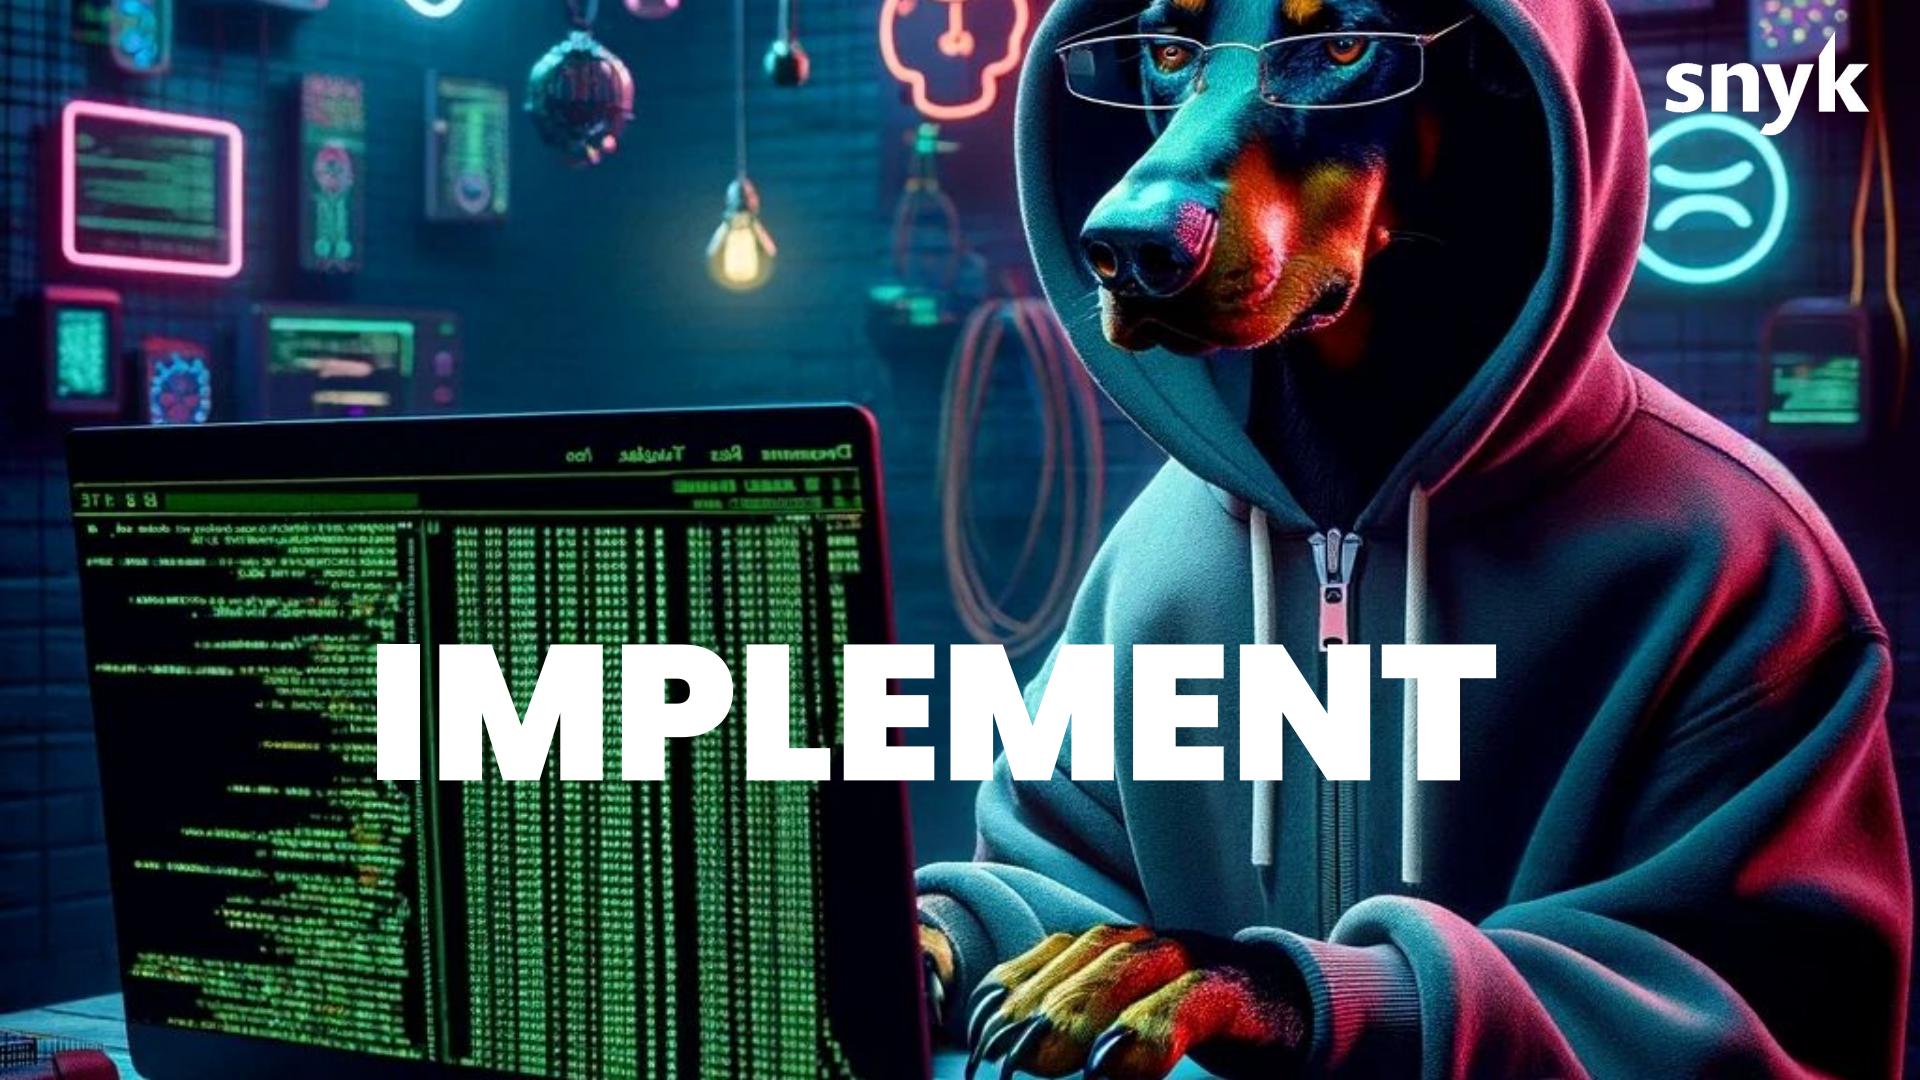

#### Best practices

Identify activities that can be completed quickly and successfully early in the project

Start with awareness / training

Adapt to coming release cycles / key projects

A dog wearing glasses and a hoodie, sitting at a desk with a laptop displaying terminal code. The background is a dark, futuristic room with glowing neon signs.

snyk

# IMPLEMENT

PREPARE

ASSESS

SET THE TARGET

DEFINE THE PLAN

IMPLEMENT

ROLL OUT

**Purpose** Work the plan

#### Activities

Implement activities

Implement all activities that are part of this period. Consider their impact on processes, people, knowledge, and tools. The SAMM model contains prescriptive advice on how to do this. OWASP projects may help to facilitate this.

#### Resources

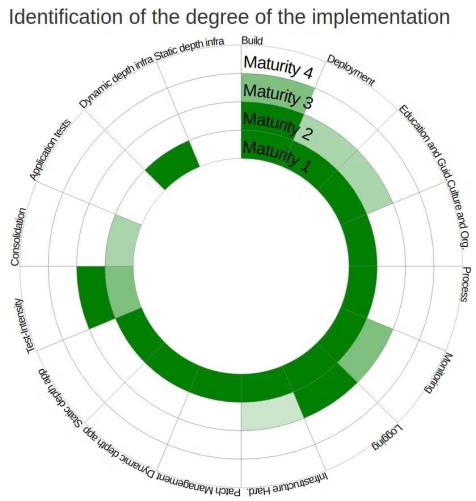

#### Best practices

Treat legacy software separately. Do not mandate migration unless really important.

Avoid operational bottlenecks, particularly for the security team

# FAQ: OWASP SAMM vs. OWASP DSOMM

The **DSOMM framework** (DevSecOps Maturity Model) consists of four levels of DevSecOps maturity. Each level represents a distinct stage in the evolution of security integration, ranging from basic awareness and ad-hoc practices to advanced, fully integrated, and automated security processes. **These levels provide a roadmap for organizations to systematically enhance their security posture within the DevOps framework.**

# Sample Target Groups

SAMM	DSOMM
“Standard”, OWASP Flagship Project	“Emerging”, OWASP Lab Project
High Level Overview	Low Level Overview
Management Topics like Compliance & Governance	Only DevSecOps Topics
Planning of High Level Targets	Planning of Concrete Targets
Works “Out of the Box”	Needs Customization

# **Recommendation from Timo Pagel**

1. Assess and plan security strategy with SAMM
2. Adapt DSOMM
